Race fuelling leaflet for Marjon running club

STUDENT BRIEF

TIME	WORK IN	FORMAT
20 minutes	Pairs or small groups	One A4 side

The scenario

The Plymouth Marjon running club has asked your group for a leaflet on race fuelling. Most members are **recreational runners**. Some are training for a **half marathon** and others for a **full marathon**. Finishing times in the club range widely, so a half marathon may take some members under 1 h 30 and others over 2 h 30, and a marathon may take from about 3 h to over 5 h.

Your leaflet should help a club runner understand what to eat and drink, how much, and when. Use what you have learned in this session, including the fuelling calculator from Task 3.

What the leaflet must cover

Before the race

- The days before, including whether carbohydrate loading is useful for each distance
- The pre-race meal, with timing

During the race

- How much carbohydrate per hour, and how this changes with finishing time
- Practical ways to carry and take it

After the race

- What and when to eat to recover
- When faster refuelling matters

Format

One A4 side made in Canva or a similar tool. Use headings, short sentences and a simple layout that a busy club runner could read in two minutes. Images or icons are welcome but keep the focus on clear advice. Put your sources in small text at the bottom.

Success checklist

- [ ] **Specific amounts** in g or g/kg, with at least one worked example for a named body mass (for example a 65 kg runner).
- [ ] **Real food and drink examples** that show how to reach the amounts (for example porridge, bagels, gels, sports drink).
- [ ] **Plain language** suitable for club runners. Explain or avoid technical terms such as glycogen or g/kg.
- [ ] **A note on practising race fuelling in training**, so nothing new is tried on race day.
- [ ] **At least two credible sources**, such as position stands or peer-reviewed reviews, cited in Harvard style.

Useful starting sources

Jeukendrup (2014) for carbohydrate during exercise, and Thomas, Erdman and Burke (2016) for before and after. Full references are at the bottom of the Task 3 fuelling calculator.
